On May 30, 2002 this sequence version replaced gi:21104241.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeates; all regions were covered by at least
one plasmid subclone or more than one MI3 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP

AL Submitted (15-NOV-2002) Human Geneme Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

The sequence in this assembly is a combination of BAC based reads (http://www.hgc.bcm.tmc.edu/projects/rat/). Each contig Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig described individual sequence contigs are ordered and oriented, and separated exent beyond the ends of the clone and there may be sequence genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Puazo, M., Quiroz, J., Rachlin, E., Reeves, K., Regier, M.A., Reigh, R., Reilly, B., Reilly, M., Ren, Y., Reuter, M., Richards, S., Riggs, F., Rives, C., Rodkey, T., Rojas, A., Rose, M., Rose, R., Ruiz, S.J., Sanders, W., Savery, G., Scherer, S., Scott, G., Shateman, S., Shen, H., Shetty, J., Shvartsbeyn, A., Sisson, I., Sitter, C.D., Smajs, D., Steimle, M., Strong, R., Sutton, A., Svatek, A., Tabor, P., Taylor, C., Taylor, T., Thomas, N., Thomas, S., Tingey, A., Trejos, Z., Usmani, K., Walas, R., Vera, V., Villasana, D., Waldron, L., Walker, B., Wang, Q., Wang, S., Warren, J., Waldron, L., Walker, B., Wang, J., Wallson, R., Wleczyk, R., Wooden, H., Worley, K., Yu, F., Zhang, J., Zhou, J., Zhou, J., Zhou, X., Zhou, X., Zhou, S., Yen, J., Yoon, L., Yoon, V., Weinstock, G. and Gibbs, R.A.

AL Submitted (10-CCT-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Oct 10, 2002 this sequence version replaced gi:21953942.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Massey, E., Mawhiney, E., McLeod, M.                                                                                      NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On Sep 21, 2002 this sequence version replaced gi:21743229.
The sequence in this assembly is a combination of BAC based reads whole genome shotgun sequening reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). As a result, the contigs that consist entirely of whole genome shotgun sequence contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)

NOTE: This sequence may represent more than one clone.

NOTE: This is a 'working draft' sequence. It currently

consists of 2 contigs. The true order of the pieces

is not known and their order in this sequence record is

arbitrary. Gaps between the contigs are represented as

runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence

as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           be preserved

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC of a compound. The method comprises preparing a gene expression profile co of a tissue or cell sample exposed to the compound, and comparing the. CC gene expression profile to a database comprising SEO ID 1-4925, where cC differential expression of the gene indicates at least one toxic effect. CC of a compound, predicting hepatotoxicity or the progression of a toxic ceffect. CC of a compound, identifying an agent that modulates the onset or cC progression of a toxic response, predicting the ecllular pathways that a CC progression of a toxic response, predicting the cellular pathways that a CC compound modulates in a cell, and identifying an agent that modulates the constitution using a database of genes having liver toxin-induced compositions of the colls for drug screening and toxicity markers in cC liver tissues or cells for drug screening and toxicity assays. Note: The specification, but was obtained in electronic format directly from WIPO cc at fftp.wipo.int/pub/published pct segmences.

                                                                                                                                                                                                                                                                                                  CC The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic cobtaining a sample having a polymucleotide encoding an alpha-2B, alpha2A cor alpha2C or fragment or complement of; and (b) detecting a polymorphic site comprising; (a) comprising nucleotide positions 901-909 of (1), a site comprising (A) core alpha2C or fragment or complement of; and (b) detecting a polymorphic cytosine or guanine at position 901-909 of (1), a site comprising (A) core site comprising (A) core method may be used for genotyping an alpha2B, alpha2A or alpha2C receptor gene and further used to determine whether an individual is at increased crist of developing a disease associated with alpha2B, alpha2A or alpha2C, comprising detecting a polymorphic site which correlate to disease selected from cardiovascular disease, central nervous system disease and combinations of these. In addition, the technique may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. cpinephrine, norepinephrine, clonidine, oxymetazoline, guanabenz, cyrazosin, ARC 239, rauwolscine, idazoxan, tolazoline, phentolamine and comprisations of these) by detecting the polymorphic site and correlating the site to a predetermined response (where the response is correlated to adenylyl cyclase, MAP kinase activity, phosphorylation or inositol complement of the human alpha-2BAR variant, the sequence is cof the wildtype gene (AAI39905)
                                                                                                                                         8
                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                              Query Match

                                                                                                                    The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) variant protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. The variant is obtained by deletion of three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and capinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a chinically expressed as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha-2B-adrenoceptor variant DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1344 BP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a number of human immune system associate genes which are modified by the methylation of cytosines. The sequences including eye diseases such as retinopathy, neovascular glaucoma and leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, arteriosclerosis, anaemia, cancer, acute myeloid rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

Tourette's syndrome, schizophrenia, psychiatric and neurological disorders, smoking, drug abuse, alcoholism, personality traits, compulsive gambling, human immunodeficiency virus dementia, migraine, behaviours in schizophrenic and schizoaffective patients, and suicidal behaviour in patients with schizophrenia. The nucleic acid is useful for detecting the methylation state of all CpG dinucleotides and/or single nucleotide polymorphisms (SNPs). The present sequence is human chemically treated genomic DNA

                                                                                                                                                                                                                                                                                          묽
                                                                                                                                                                                                                                                                                                                          The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic CC receptor gene (I)-(III) by detecting a polymorphic site, comprising; (a) cobtaining a sample having a polymorlation so the comprising and polymorphic site, comprising; (a) cC or alpha-2B or fragment or complement of; and (b) detecting a polymorphic cities comprising nucleotide positions 901-909 of (I), a site comprising (A) CC cytosine or guanine at position 753 of (IIV) or a site comprising (A) CC (site comprising at positions 961-972 of (III)). The cytosine or guanine at position 753 of (IIV) or a site comprising (A) CC (site comprising at positions 961-972 of (III). The cytosine of further used for genotyping an alpha-2B, alpha-2A or alpha-2C receptor cytosine for general cytosine whether an individual is at increased crisk of developing a disease associated with alpha-2B, alpha-2A or alpha-2, comprising detecting a polymorphic site which correlate to disease selected from cardiovascular disease, central nervous system disease and combinations of these. In addition, the technique may be used to predict cytosinations of these. In addition, the technique may be used to predict cytosinations of these. In addition, the technique may be used to predict cytosinations, norepinephrine, clonidine, oxymetazoline, guanabenz, cymazosin, ARC 239, rauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlating the site to a predetermined response (where the response is correlated to phosphate levels). The present sequence is that of the third constitute a polymorphic site at nucleotides 901-019, absent in the alpha-2BAR (GenBank Accession AF009500), the sequence includes a 9 nucleotide polymorphic site at nucleotides 901-019, absent in the alpha-2BAR (GenBank Accession AF009500).
                                                                                                                                                                                                    Best Loc

Alpha2B-AR has a glutamic acid repeat element cacids (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino the receptor polypeptide. Alpha2B-AR gene is located on chromosome 2. Calpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-Catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-Catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-Catecholamines, norepinephrine and epinephrine suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries and a disease involving vascular coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as conficulally expressed as Prinzmetal's variant form or acute myocardial ax conficulation (AMI). Alpha2B-AR gene is used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 27-29; 35pp; English.

                                       A genomic DNA clone (AAT59499) codes for human alpha-2B adrenergic receptor (AAW11804), a member of the rhodopsin-like signal transducer family. It was isolated from a human spleen genomic library in the lambda vector Charon 28 by screening with a 1.6 kb fragment of the human 5-hydroxytryptamine receptor gene. Plasmid pNGC-alpha-2B comprising DNA encoding the alpha-2B adrenoceptor is deposited as ATCC 68144. Vectors have been adapted to allow prodn. of alpha-2B adrenoceptor in bacterial, yeast or mammalian cells; transfected Ltk- cells, designated L-NGC-alpha-2B, are deposited as ATCC CRL 10275. Membranes of such cells can used in novel methods to identify drugs which specifically interact with, and in the second control of the second cells are deposited as ATCC CRL 10275.
                                                                                                                                                                                                                                                                                                           Disclosure; Fig 2A-E; 16pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Clone NGC-alpha2beta was isolated from a human spleen genomic library screening with a fragment of the human 5-HTA receptor gene. The gene be used to express recombinant receptor protein which can be used to produce antibodies for inhibition of receptor function
                                                                                                                                                                                                                                                                                                                                                                                   Assay for alpha-2b adrenergic receptor ligands - using membranes of cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hart1g

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S X
                                                                                                                                      CC polynuclectide probes comprising a sequence selected from one of the 1490 CC sequences mentioned in the specification. The combination is useful as an CC array element in a microarray for monitoring the expression of a number CC of target polynucleotides. The microarray is particularly useful in the CC diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug CC discovery and development, toxicological and carcinogenicity studies, CC monitoring progression of diseases and for developing sophisticated CC profiles for the effects of currently available therapeutic drugs. The CC combination is also useful for purifying a subpopulation of mRNAs, cDNAs CC array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose CC various diseases including cancer e.g. adenocarcinoma and leukaemia, disease of immunorathies are although as them a compression of a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present invention describes antigenic peptides (I) comprising: (a) CC any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular GC and (2) an isolated antibody having high specificity and high affinity or captidity for a particular GPCR. (I) can be used as GPCR modulators and in the polydespecial peptides for GPCR antibody against a particular GPCR. (I) can be used as GPCR modulators and in the polydespecial control of the specific captides for GPCRs and in the production of specific captides and antibodies are also useful in detecting an CC presence or absence of corresponding GPCRs. The antigenic peptides for CC GPCRs and antibodies are useful for detecting the CC treating immune-related diseases, growth-related diseases, cell used the second control of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 1; 523pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or

The invention relates to novel purified or isolated nucleic acids of cessential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object characterisation or to prevent or inhibit formation on a surface of a comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. CC fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and comparing oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an expension patterns, for raising anti-protein antibodies, as an confidence of a surface correlative receptors or to identify inhibitors of the binding cours or to identify inhibitors of the binding cours of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence contained to the essential contained to the invention of the essential contained to the invention of the essential contained to the invention of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

CC organism such as A. timigatus, to treat a non-infectious disease in a CC subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a CC biofilm comprising A. fumigatus. The polynucleotides are useful for CC companisms invade or reside, for comparing with the DNA sequence of A. CC fumigatus to identify duplicated genes or paralogues having the same or CC similar biochemical activity and/or function, for comparing with DNA CC sequences of other related or distant pathogenic organisms to identify CC potential orthologous essential or virulence genes, for selecting and CC making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an CC antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polynucleotides encoding the binding CC interaction. The polypeptides may be used to raise antibodies or to clicit immune response, as a reagent in assays designed to quantitatively host tissues in which pathogenic organism livade or reside, and to constitute correlative receptors or ligands in the case or virulence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The invention relates to novel purified or isolated nucleic acids of CC essential genes of Aspergillus funigatus. The isolated nucleic acids of CC the invention are used to treat or prevent infections by a pathogenic CC organism such as A. fumigatus, to treat a non-infectious disease in a CC subject (e.g. cancer), to prevent or contain contamination of an object CC by A. fumigatus, or to prevent or inhibit formation on a surface of a CC by A. fumigatus. The polynucleotides are useful for CC contain comprising A. fumigatus. The polynucleotides are useful for CC expressing recombinant protein for characterisation, screening or CC contains invade or reside, for comparing with the DNA sequence of A. CC contains invade or reside, for comparing with the DNA sequence of A. CC similar biochemical activity and/or function, for comparing with DNA CC contential orthologous essential or virulence genes having the same or sequences of other related or distant pathogenic organisms to identify CC making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an CC response, and for identifying polynucleotides encoding the other protein interaction. The polypeptides may be used to raise antibodies or to identify the binding occurs or to identify inhibitors of the binding country interaction. The polypeptides may be used to raise antibodies or to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş

CC The invention relates to novel purified or isolated nucleic acids of CC essential genes of Aspergillus fumigatus. The isolated nucleic acids of CC the invention are used to treat or prevent infections by a pathogenic conganism such as A. fumigatus, to treat a non-infectious disease in a CC by A. fumigatus, to treat a non-infectious disease in a CC by A. fumigatus, to treat or contain contamination of an object confirm comprising A. fumigatus. The polynucleotides are useful for CC expressing recombinant protein for characterisation, screening or CC indigatus to identify duplicated genes in which the pathogenic CC fumigatus to identify duplicated genes or paralogues having the same or CC similar biochemical activity and/or function, for comparing with the DNA sequence of A. CC sequences of other related or distant pathogenic corganisms to identify and/or function, for comparing with DNA cC sequences of other related or distant pathogenic organisms to identify and/or function and organisms to identify corganisms to identify corganisms to identify and/or function organisms to identify and corporate or attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This polynucleotide sequence represents one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hybridisation assay; genetic mapping; gene eprotein identification; signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                          Porcine and human SPAR cDNAs were compared. They are highly homologous, divergent. The 32.3 kDa human and 32.8 kDa porcine ORFs are show structural features consistent with cell membrane-bound receptors. Porcine counterpart. The pspar protein is predicted to that of its a secondary structure of hspar ORF is similar to that of its porcine counterpart. The pSPAR protein is predicted to have a hydrophoic a second alpha helix of 28 residues beginning at AA 48. It is followed by a turn, pleated sheets. Human SPAR ORF has a 25 AA hydrophobic alpha-helix near a second alpha helix of 24 residues then a series of turns and betastring at residue 29, followed by beta-pleated sheets and turns. Another 28 residue beta- helix begins near AA 200. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş

CC designated ORF (open reading frame) 1-4334, and sequences ABN75054-CC ABN75897 represent cDNAs encoding them. The invention also encompasses CC polypeptides at least 80% identical to the ORF1-ORF4534 (collectively CC referred to as ORFX) proteins, polynucleotides at least 85% identical to CC the ORFX nucleic acid sequences, vectors and host cells comprising ORFX CC polynucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and CC polypeptides, methods of screening for modulators of ORFX expression or CC activity, and methods of screening individuals for a predisposition to an CC orex-associated disorder. The ORFX proteins of the invention have a wide crange of biological activities, such as cytokine, cell proliferation, CC clisue growth, angiogenesis, activitor, haematopoiesis regulation, creceptor/ligand, antiinflammatory activity, thrombolytic activity, cand mitinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, cultivated as and antibodies may be used in the treatment of cancers, cother proliferative disorders such as epilepsy and Alzheimer's disease, cardiovascular diseases, immune system disorders, disorders related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁

ORFX nucleic acids may also be used as a source of primers and probes, in the detection of ORFX genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of ORFX-associated diseases

                                       The present sequence encodes a new sulphonylurea receptor (SUR2) protein isolated from a rat brain cDNA library. The sequence can be derived from animals such as human or rat. Products of SUR2 can be used for diagnosis and treatment of potassium channel diseases, e.g. hypertension and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
The invention relates to a novel method of predicting at least one toxic effect of a compound. The method comprises a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising at least part of the data or information given in the specification. The methods are useful for predicting at least one toxic effect of a compound, predicting the renal toxic of a compound, predicting the renal toxicity of a compound, or identifying toxicity markers in tissues or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22-MAY-2001; 2001US-0292335P.

CC The present invention relates to a method for predicting a toxic effect CC of a compound. The method comprises preparing a gene expression profile conference of the sample exposed to the compound, and comparing the CC gene expression profile to a database comprising SEQ ID 1-4925, where CC differential expression of the gene indicates at least one toxic effect. CC compound, predicting hepatotoxicity at least one toxic effect of a CC of a compound, identifying an agent that modulates the onset or CC compound modulates in a cell, and identifying an agent that modulates the onset or CC compound modulates in a cell, and identifying an agent that modulates the cellular pathways that a CC least one activity of a protein. The method and compositions of the CC differential expression, are useful in identifying toxicity markers in the rissues or cells for drug screening and toxicity assays. Note: The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADB58175 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cells exposed to known renal toxin. The genes are useful as toxicity markers in drug screening and toxicity assays, in menitoring disease physiological states, or disease progression. This polynucleotide represents a rat DNA sequence relating to the toxic effect database described in the specification. NOTE: The sequence data for this pate did not form part of the printed specification, but was obtained in electronic format directly from the World Intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 5000 BP; 1238 A; 1284 C; 1246 G;

The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for

The sequence given encodes the rat insulin receptor substrate-1 (IRS-1). The IRS-1 was isolated using the probe sequences given in AAQ29701-02. The IRS-1 sequence can be inserted into a vector and used to transform cells to produce IRS-1. The level of IRS-1 metabolism can then be studied and abnormal levels may be seen to be indicative of insulin related disease. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence is that of murine ovary-specific O1-236 cDNA. O1-236 CC is the mammalian orthologue of xenopus laevis nucleoplasmin, and the O1-CC 236 gene has been named Npm2 (see also ABZ24594). O1-236 clones were CC initially identified by subtractive hybridisation using ovaries from Gdf9 CC knockout and wild-type mice. Full-length Npm2 cDNA (clone 236-1) was used CC chromosome 14. Loss of Npm2 gene in a genomic library. This gene maps to CC chromosome 14. Loss of Npm2 results in female infertility and converted to the invention provides ovary-specific and occyte-specific CC golypeptides. These genes and their protein products appear to relate to involving ovarian tumours, such as germ line tumours and granulosa cell provides a method for detection of a cell proliferative or degenerative ovarian failure. The invention CC ol-184 or O1-236. It also provides a method for treating such disorders of the ovary, which is associated with the expression of O1-180, O1-184 or O1-236, and a method of screening for compounds that gene a method of screening for compounds that genes. These compounds are possible contraceptive or fertility enhancing cc polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABZ24593

                                                                             The present sequence is the mouse oocyte-specific gene Npm2, complete CDNA clone O1-236. It is derived from mouse 2-cell embryo cDNA library and expressed in the oocytes of intermediate size type 3a follicles and all type 3b follicles. This clone is used to screen and identify the mouse Npm2 gene. It is homologous to Xenopus laevis nucleoplasmin (Xnpm2) expressed exclusively in eggs. It provides in vitro and in vivo reagents for studying ovarian development and function. This sequence has gynaecological and contraceptive activity. Agents which modulate O1-180, O1-184 and O1-236 may be used to treat cell proliferative or degenerative genes. This ovary-specific sequence can be used as reagents to evaluate potential contraceptives, to block ovulation in a reversible manner. It is also used to screen for genetic mutations in signalling pathways, that are associated with some forms of human infertility or gynaecological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01\text{-}180, 01\text{-}184 and 01\text{-}236 polypeptides and nucleic acids encoding useful for evaluating potential contraceptives to block ovulation reversible manner.

                                                                                                                                                                                                                             CC The present sequence is the mouse ovary-specific Npm2 gene, mapped to the middle of mouse chromosome 14. It shows linkage to D14Mit32, this region cc being syntenic to human chromosome 8p21. The clone 01-236 cDNA is used to screen and identify Npm2 gene. It is the mammalian ortholog of xenopus clavis nucleoplasmin (Xnpm2) expressed exclusively in the eggs. It cc and function. This sequence has gynaecological and contraceptive activity. Agents which modulate 01-180, 01-184 and 01-236 may be used to treat cell proliferative or degenerative disorders, associated with cc admormal expression of these ovary specific genes. This ovary-specific contractions in a reversible manner. It is also used to screen for cc generic mutations in signalling pathways, that is associated with some xx form of human infertility or gynaecological cancer

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TROPICALIS_SEQUENCE ID: TEGG106k18.plkSp6
Sequencing primer: $\frac{7}{8}6$
This sequence is from a Xenopus Gene Collection (XGC) library constructed by Aaron M. Zorn.

CONA was oligo dT primed from Sug of poly A+ RNA from egg.

ECORI-Not1 cut cDNA was then ligated into pCS107 with EcoRI at 'end and Not1 at the 3' end.

Vector: pCS107; Site 1: EcoRI; Site_2: Not1

Host: Escherichia coli XLI-blue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sanger Institute
